

3. knots in contact 3-manifolds

An embedding $K: S^1 \hookrightarrow (M^3, \eta)$ is called

* Legendrian knot : $(\subset) \quad T_k \subset \eta$

* Transverse knot : $(\subset) \quad T_k \cap \eta = \emptyset$

h_0 is isotopic to $h_1 = \pm$

$\exists h_t, t \in I, h_t$ is Legendrian (transverse) $\forall t$.

Notation $k \in (M, \eta)$ for the isotopy class

Example: (1) $S^1 \hookrightarrow \mathbb{R}^3 / 2\pi \mathbb{Z} \ni t \mapsto (\cos(t), \sin(t), t) \in (\mathbb{R}^3, \eta_{std} = \ker(x dy - y dx))$
 is a Legendrian unknot.

it's Legendrian: take the framed, plug it into α

if it's 0 \Rightarrow it's Legendrian

(1) $S^1 \ni \theta \mapsto (\theta, 0, 0) \in (S^1 \times \mathbb{R}^2, \eta = \ker(\cos \theta dx - \sin \theta dy))$ is Legendrian.

(2) $S^1 \ni \theta \mapsto (\theta, 0, 0) \in (S^1 \times \mathbb{R}^2, \eta = \ker(d\theta + r^2 dy))$ is transverse.

3.1) Neighborhood & isotopy extension theorems

Thm 1: (1) Let $k \in (M, \eta)$ be Legendrian. $\Rightarrow \exists$ tubular nbhd V_k of k in M s.t.

$$\forall r > 0 \quad \forall n \in \mathbb{Z} \setminus \{0\}: (V_k, \eta) \stackrel{\text{cont}}{\cong} (S^1 \times D_r^2, \eta_n)$$

$$k \mapsto S^1 \times 0$$

(2) Let $k \in (M, \eta)$ be transverse. $\Rightarrow \exists$ tubular nbhd V_k of k in M

$$\& \exists \varepsilon > 0 \text{ s.t. } (V_k, \eta) \stackrel{\text{cont}}{\cong} (S^1 \times D_\varepsilon^2, \ker(d\theta + r^2 dy))$$

$$k \mapsto S^1 \times 0$$

Proof: $\# \checkmark$ \Rightarrow Use Moser trick as in Darboux theorem

(2)

Thm 2: Let $k_t: S^1 \hookrightarrow (M^3, \eta)$ be an isotopy of Legendrian (transverse)

knots. $\Rightarrow \exists$ isotopy of contactomorphisms

$$\psi_t: (M, \eta) \xrightarrow{\cong \text{ (cont)}} (M, \eta) \text{ s.t.}$$

$$\psi_0 = \text{id}$$

$$\& \psi_t \circ k_0 = k_t$$

Proof: Construct Ψ_t as flow of a contact vectorfield from a Hamilton function.
(4-)

9.2 The front projection

Let $K \subset (S^3, \gamma_{\text{std}})$ be a knot

Thm 2.4

\Rightarrow We can see $K \subset (\mathbb{R}^3, \gamma_{\text{std}})$

$(x(y, z) \mapsto (y, z))$ front projection

$S^1 \ni t \mapsto (x(t), y(t), z(t)) \in (\mathbb{R}^3, \gamma_{\text{std}} = \ker(x dy + y dz))$

is Legendrian $(\Leftrightarrow) 0 = \alpha(\dot{\gamma}(t)) = x(t) \cdot y'(t) + y(t) \cdot z'(t) \quad \forall t$

If K is generic (i.e. $y'(t) \neq 0$ only for finitely many t)

$$\Rightarrow x(t) = -\frac{z'(t)}{y'(t)} = -\frac{dz}{dy} \quad (\text{if } y'(t) \neq 0 \Rightarrow z'(t) = 0)$$

i.e. we can recover K from its front projection on \mathbb{R}^2

Certain configurations do not appear as front projections of Legendrian knots.

* if $y' \geq 0 \Rightarrow z' \geq 0 \Rightarrow$ there can't be vertical tangencies

Important: semicubical cusps?

$$(x(t), y(t), z(t)) = (t, t^2, -\frac{2}{3}t^3)$$

(every Legendrian knot has at least 2 of them)

* no crossing as follows:

Legendrian:

\Rightarrow Any such front projection describes a unique Legendrian knot.

Legendre's: We have Legendre knots in the front projection

Examples:

is oblique to one of those on the left

helix

helix

Figure 8

Figure 8

Corollary 3: For every smooth knot $K \in C(n^3, \epsilon_0)$
 \exists isotopic knot $K' \in C(n^3, \epsilon_0)$ Leg.

Proof: front of K

If h is positively transverse, i.e. $x_{y'} + z' > 0$

Then: If $y' = 0 \Rightarrow z' > 0$

$$\text{If } y' > 0 \Rightarrow x > -\frac{z'}{y'} = -\frac{dz}{dy}$$

$$\text{If } y' < 0 \Rightarrow x < -\frac{dz}{dy}$$

\Rightarrow The following configurations are excluded

All other configurations lift to transverse curves in $(\mathbb{R}^3, \zeta_{st})$ unique up to

shifts in x -direction

trivial

thm 4: Let $h: S^1 \hookrightarrow (\mathbb{R}^3, \zeta)$ a smooth knot

$\Rightarrow h$ can be C^0 -close approximated by a Legendrian (transverse) knot smoothly isotopic to h .

proof: Legendrian case

case 1: Let $\gamma: (a, b) \hookrightarrow (\mathbb{R}^3, \zeta_{st})$ be an arc

Approximate the front of γ by a Legendrian front projection s.t. $-\frac{dz}{dy}$ is close to the x -component of γ .

case 2: If $\gamma: (a, b) \hookrightarrow (\mathbb{R}^3, \zeta_{st})$ is Legendrian near a & b

then we can choose the approximation near a & b to agree with γ .

case 3: $h: S^1 \hookrightarrow (\mathbb{R}^3, \zeta)$ a knot. S^1 compact $\xrightarrow{\text{Lebesgue}} \exists$ decomposition of S^1 into intervals I_i s.t. $h(I_i) \subset$ Darboux ball then use case 2.

Transverse case

Let $L : S^1 \longrightarrow (\mathbb{R}^3, g)$ be a Legendrian approximation of k .

Then $\omega \log L(t) = (\theta = t, x=0, y=0) \in (S^1 \times \mathbb{R}^2, \alpha = (\cos \theta dx - \sin \theta) dy$

$$L_{\pm} := (\theta = t, x = \pm \epsilon \sin(t), y = \pm \epsilon \cos(t)) \quad \text{for } \epsilon > 0 \text{ small}$$

$$\Rightarrow L_{\pm} := (\gamma, \pm \epsilon (\cos(t), -\sin(t)))$$

$$\alpha(TL_{\pm}) = \pm \epsilon (\cos^2(t) + \sin^2(t)) = \pm \epsilon$$

L_{\pm} are called transverse push-offs of L

real world application:

3.4 Seifert surfaces & the Alexander polynomial

Let $k \in S^3$ A smooth knot

Ex:

unknot

trefoil

Fig-8

Lemma 5: $\forall k \subset S^3 \exists$ Seifert surface, i.e. $F^2 \xrightarrow{\text{surj}} S^3$ compact, oriented, s.t. $\partial F = k$

proof: (1) Let D be a diagram of k

(2) orient D

(3) resolve crossings following orientation

(4) get collection of circles in the plane

(5) glue in a twisted band for every crossing

D

Stabilization

F a Seifert surface of K

Thm 6 [Reidemeister - Singer] Any two Seifert surfaces of K have a common stabilization.

(Seifert)-genus: $g(K) := \min \{g(F) \mid F \text{ a Seifert surface of } K\}$

Ex: $g(K) = 0 \iff K = 0$

$g(\bigcirc) \leq 1$

Links: Let $K \subset M^3$ an oriented knot if K is nullhomologous i.e. $[K] = 0 \in H_1(M)$

$\Rightarrow H_1(M \setminus \nu K) = \bigoplus_{\mu \in \mu(K)} H_1(M)$

Let K_1, K_2 be oriented knots in M s.t. K_1 & K_2 are nullh.
The linking number $lk(K_1, K_2) \in \mathbb{Z}$ is defined $[K_2] = lk(K_1, K_2) [K_1] \in H_1(M \setminus \nu K_1) \cong H_1(M) \oplus \mathbb{Z} \langle [K_1] \rangle$

$lk(K_1, -K_2) = lk(-K_1, K_2) = -lk(K_1, K_2)$

$[K_2] = -[K_1] \Rightarrow lk = -1$

$[K_2] = -[K_1] + [K_1] = 0$

$lk = 0$

Lemma 7: (1) $h \subset S^3$ is nullhomologous $\Leftrightarrow h$ admits a Seifert surface

$$(2) \quad Lk(h_1, h_2) = h_1 \cdot F_2$$

where F_2 is a Seifert surface of h_2

Proof: (1) " \Leftarrow " part of Lemma

" \Rightarrow " in S^3 Seifert alg.

general case in discussion session

(2) Let $h_1 \cdot F_2 = n > 0$ (algebraic intersection number)

$h_2 - n \mu_1$ bounds a surface but does not intersect h_1

$$Lk(h_1, h_2 - n \mu_1) = 0 \in H_1(M \setminus h_1)$$

$$Lk(h_1, h_2) = n = h_1 \cdot F_2$$

Lemma 8 Let $h_1, h_2 \subset S^3$ be oriented knots

$$\Rightarrow Lk(h_1, h_2) = \# \text{ crossings of } h_2 \text{ under } h_1 \text{ with signs}$$

Corollary 9: $Lk(h_1, h_2) = Lk(h_2, h_1)$ proof: "look at the diagrams from behind the blackboard"

Proof (Lemma 8): $Lk(h_1, h_2 \pm \mu_1) = \pm 2$

$$\bullet Lk(h_1, h_2 \pm \mu_1) = Lk(h_1, h_2) \pm 1$$

$n = \#$ crossings of k_2 under k_1

$\Rightarrow k_2 - n \mu_1$ has no undercrossings with k_1

$\Rightarrow \ell k(k_1, k_2 - n \mu_1) = 0 \Rightarrow \ell k(k_1, k_2) = n$

w.l.s :

$g(k) := \min \{g(F) \mid F \text{ is a Seifert surface of } k\}$

$[k_1] = \ell k(k_1, k_2) [\mu_{k_2}] \in H_1(S^3 \setminus k_2) \cong \mathbb{Z} \langle \mu_{k_2} \rangle$
 // Lemma 8

$\#$ crossings of k_2 over k_1 counted with signs

$\ell k(k_1, k_2) = -2$

Alexander polynomial:

seifert form Let F be a Seifert surface of an oriented knot k .

$$S: H_1(F) \times H_1(F) \longrightarrow \mathbb{Z}$$

$$(a, b) \longmapsto \ell k(a, b^+)$$

\uparrow
 push-off of b in
 positive normal dir. of F

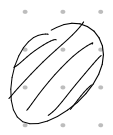

Alexander polynomial: $\Delta_k(F) := \det(t^{-1/2} S - t^{1/2} S^T)$

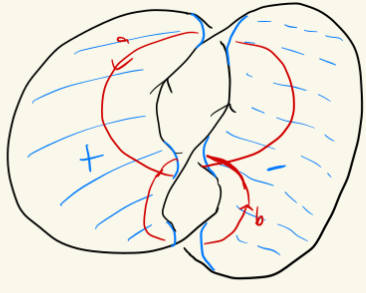

Corollary 10: $\Delta_h(t)$ is a knot invariant.

proof sketch: $\Delta_h(t)$ is independent of the Loren matrix: $S = \rho S \rho^T$ with $\det \rho = \pm 1$

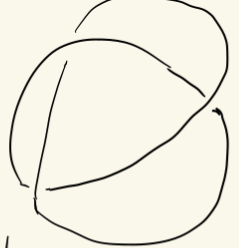

$\ast F'$ is a different defect surface $\Rightarrow F'$ & F have a common stabilization \bar{F}

$\ast \bar{F}$ is a stabilization of $F \Rightarrow \bar{S} = \begin{pmatrix} S & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix} \Rightarrow \det(t^{n/2} \bar{S} - t^{-n/2} \bar{S}^T) = \det(t^{n/2} S - t^{-n/2} S^T)$

Examples:  $F =$  $H_1(F) = 0 \Rightarrow S = 0 \Rightarrow \Delta_h(t) = 1$

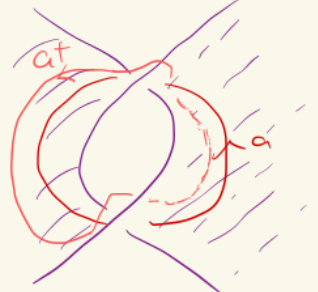

\approx
 \uparrow
Perd-mister moves

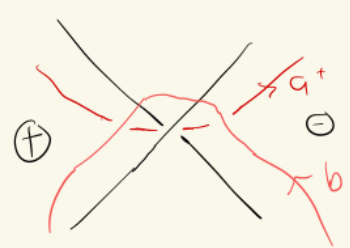

$F \equiv T^2 \setminus \dot{D}^2 = \mathbb{D}^2$

$\Rightarrow H_1(F) \cong \mathbb{Z}_{\langle a, b \rangle}^2$

$S = \begin{pmatrix} \text{ll}(a, a^+) & \text{ll}(b, a^+) \\ \text{ll}(a, b^+) & \text{ll}(b, b^+) \end{pmatrix}$

$\Rightarrow S = \begin{pmatrix} -1 & 0 \\ 1 & -1 \end{pmatrix}$

$\Rightarrow \Delta_{\mathbb{Q}}(t) = \det \begin{pmatrix} -t^{n_1} & 0 \\ t^{n_1} & -t^{n_1} \end{pmatrix} - \begin{pmatrix} -t^{n_1} & t^{n_2} \\ 0 & -t^{n_2} \end{pmatrix}$

$= \det \begin{pmatrix} t^{n_2} - t^{n_1} & -t^{n_2} \\ t^{n_1} & t^{n_2} - t^{n_1} \end{pmatrix}$

$= t + t^{-2} - 2 + 1 = t - 1 + t^{-1} \neq 1$

$= \Delta_0$

Hw: $\Delta_{fgr}(t) = t - 3 - t^{-1}$

Corollary: $\text{dy}(\Delta_h) \leq g(h) \quad \left(S \in \mathcal{M}_{2g, 2g}(\mathbb{Z}) \right)$

Hw: $\forall g \in M_0 : \exists h_g : g(h_g) = g$ (maybe via torus knots?)

3.5 Classical Invariants

Let $K \subset (\mathbb{R}^3, \xi)$ be a Legendrian knot.

(Def: $tb(K) := \# \text{ twists of } \xi \text{ around } L$

$rot(K) := \# \text{ twists of } TL \text{ in } \xi$

Stabilization:

Contact longitude of K : $\lambda_c = \text{push-out of } K \text{ in the Reeb-direction}$

Thurston-Bennequin invariant: $tb(K) := lk(K, \lambda_c)$, K nullhomologous

Ex:

$$tb(K) = lk(K, \lambda_c) = -7$$

$$R_0 = \partial \Sigma$$

$$tb(K) = lk(K, \lambda_c) = -2$$

Lemma 12: Let $K \subset (\mathbb{R}^3, \xi_{st})$ be a Legendrian knot presented in front proj.

then $tb(K) = -\frac{1}{2}C + W$

$C := \# \text{ cusps in front}$

$W := \# \text{ positive crossings} - \# \text{ negative crossings}$
 $= \text{writhe of front}$

Proof: \square

Ex

$$tb = -\frac{1}{2}C + W = -\frac{1}{2} \cdot 4 + 3 = 1$$

Let $K \subset (\gamma, \xi)$ be an oriented, nullhomologous legendrian knot with Seifert surface Σ .

$$\text{rot}(K, [\Sigma]) := \langle e(\xi, K), [\Sigma] \rangle = \text{pd}(e(\xi, K) \cdot [\Sigma])$$

$\cong \# \text{ zeros of extension of } TK \text{ over } \Sigma$

$\cong \# \text{ rotations of } TK \text{ relative to a trivialization of } \xi \text{ over } \Sigma$

If ξ is trivializable, i.e. $\exists x_1, x_2$ v.f. st. $\xi = \langle x_1, x_2 \rangle$,

then $\text{rot}(K) \cong \# \text{ rotations of } TK \text{ relative to this trivialization.}$

Ex: $\xi_{\text{std}} = \text{Ker}(x dy + dz) \Rightarrow x_1 = \partial_x, x_2 = \partial_y - x \partial_z$ span ξ_{std} .

Remark: $\text{rot}(-K) = -\text{rot}(K)$

Lemma 7.3.1: $\text{rot}(h) = \frac{1}{2} (C_- - C_+)$

If q is initialized (i.e. $\exists x_1, x_2$ s.t.

prob: Initialization of $\vec{t}_{st} = \langle \partial_x, \partial_y - x \partial_z \rangle$

\Rightarrow yields a $(+)$ contribution to $\text{rot}(k)$

smaller

Yields a $(-)$ contribution

$$\Rightarrow \text{rot}(k) = \# \text{left down cusps} - \# \text{right up cusps}$$

If we count w.r.t. $-\partial_x$

$$\Rightarrow \text{rot}(k) = \# \text{right down cusps} - \# \text{left up cusps}$$

$$\Rightarrow \text{rot}(h) = \frac{1}{2} (C_- - C_+)$$

Thm 14: [Bennequin]

If $K \subset (M^3, \xi_{st})$ is a Legendrian knot $\Rightarrow \underbrace{tb(K) \pm rot(K)}_{\text{Contact geometry}} \leq \underbrace{2g(K)-1}_{\text{Smooth topology}}$

Proof: in section 4/5

□

Corollary 15: $(M^3, \xi_{st}) \stackrel{\text{cont.}}{\neq} (M^3, \xi_{OT})$

Proof: \exists Legendrian knot K in (M^3, ξ_{OT}) s.t. $TB(K) = 0$

$\Rightarrow TB(K) \pm rot(K) = \pm rot(K) > 0$ for one orientation on K

but $2g(K)-1 = -1$

If (M, ξ) contains a Legendrian knot with $tb = 0$ then $(M, \xi) \neq \emptyset$ called overtwisted. If not then it is called tight.

Thm 16 [Eliashberg]

(1) If ξ_1 & ξ_2 are OT contact structures on a closed 3-manifold M , then

$\xi_1 \stackrel{\text{isotopic}}{=} \xi_2 \Leftrightarrow \xi_1$ is homotopic to ξ_2 as tangent 2-plane fields.

(Contact geom.)

(alg. top.)

(2) (M, ξ) is tight $\Leftrightarrow \forall K \subset (M, \xi)$ null-homologous \wedge (s):

$$TB(K) \pm rot(K) \leq 2g(K) - 1$$

(3) If (M, ξ) admits a symplectic filling

$\Rightarrow M$ is tight.

(4) $S^3, M^3, S^2 \times S^2$ have unique tight contact structures

(5) T^2 has infinitely many contact structures [Gromov, Honda]

(6) $\exists M^3$ without tight contact structures (Etnyre - Honda)

Proof: section 4/5?

□

Thm 17 [Eliashberg - Thurston]

Every Legendrian unknot in (M^3, ξ_{st}) is a stabilization of

Proof: in section 4

□

Etnyre - Honda: similar results for pretails & figure-8 knots

Thm 18 [CHERKALOV]

Smooth isotopic Legendrian knots

$\nabla \beta = -5 + 6 = 1$ Rot = 0

$\nabla \beta = 7$ Rot = 0

with same tb & rot, but not isotopic as Legendrian knots.

[Distinguished by their contact homologies].

However k_1 & k_2 are isotopic after one stabilization (Hart)

Transverse Knots

Let $K \subset (M, \gamma)$ be transverse and nullhomologous & choose a section surface for K . Then we can define the

Self-linking Number

$SL(K, [\Sigma]) := lk(K, K')$

$K' :=$ push-off of K in direction of a non-vanishing vector field on $\Sigma|_K$

If η is trivializable

$K' :=$ push-off of K in direction of any non-vanishing vector field on Σ .

Lemma 19.5 $K \subset (M^3, \gamma_{st})$ is transverse & presented in the front

$\Rightarrow SL(K) = w$

proof: $0 \neq \partial_x \in \gamma_{st}$ $K' =$ push-off of K in x -dir $\Rightarrow lk(K, K') = w \quad \square$

Ex:

Stabilization

$SL(K) = lk(K, K') = -7$

$SL = -3$

Thm 20: [B&S 5.2]

is a stabilization of

Every positive integer

is less than

$(n^3, \frac{1}{2})$
