

2. Contact Manifolds

2.1 Hyperplane fields

$M^n = \text{smooth } n\text{-manifold}$

$$(p) \mapsto \xi_p^{\text{an}} \subset T_p M^n$$

$\xi \in TM$ is called hyperplane field $\Leftrightarrow \forall p \in M \exists$ neighborhood U of p and linearly independent vector fields x_1, \dots, x_{n-1} on U s.t. $\forall q \in U$:

$$\xi_q := \xi \cap T_q M = \langle x_1(q), \dots, x_{n-1}(q) \rangle$$

ξ is called co-orientable $\Leftrightarrow TM/\xi$ is orientable

Def: Vector bundle over M^n

$$\begin{array}{ccc} E & \xrightarrow[\text{Fib isom}]{p^{-1}(U) \cong U \times \mathbb{R}^k} & U \times \mathbb{R}^k \\ \downarrow p & \searrow p & \swarrow p \\ M^n \ni p & & U \end{array}$$

Why is TM/ξ a bundle?

$$\xi_q = \langle x_1(q), \dots, x_{n-1}(q) \rangle$$

$$\mathcal{N}_q = \xi_q^\perp$$

$$p^{-1}(U) \cong U \times \mathbb{R}$$

$$p^{-1}(U) \cong U \times V_p$$

Lemma 1: $\xi \in TM$ is coorientable $\Leftrightarrow \exists$ 1-form α on M s.t. $\xi = \ker(\alpha)$ (18.10.23)
(i.e. $\alpha_p : T_p M \rightarrow \mathbb{R}$)

proof: Let g be a Riemannian metric.

" \Rightarrow " Choose a vector field Z on M with

$$\begin{cases} g(Z, X) = 0 & \forall X \in \xi \\ g(Z, Z) = 1 \end{cases}$$

$$\alpha := g(Z, \cdot)$$

" \Leftarrow " A vector field Z with $\begin{cases} g(Z, Z) = 1 \\ \alpha(Z) \neq 0 \end{cases}$ defines a coorientation of ξ

convention: we restrict to coorientable hyperplane fields
(often this is secretly assumed)

Example:

$$M^n := S^1 \times \mathbb{N}^{n-1}$$

$$\forall p = (\theta, x) \in M = S_p := T_x \mathbb{N} \subset T_p M$$

$$\xi = \bigcup_{p \in M} \xi_p \text{ is a hyperplane field}$$

$$\xi = \ker(d\theta) \quad (\text{odd } n\text{-foliation})$$

glue left and right side together

Foliation: $\gamma = \bigcup_{\theta \in \Lambda} \tilde{F}_\theta$ is called n -dim foliation

(6) \exists Atlas of M (U_α, h_α) s.t. $\forall \theta \in \Lambda: h_\alpha(F_\theta \cap U_\alpha) = \emptyset$ or $\mathbb{R}^h \times p \cap h_\alpha(U_\alpha)$

Ex: Flow lines of a non-vanishing vector field are 1-dimensional foliations

$$M = T^2$$

If slope $\in \mathbb{Q} \Rightarrow$ leaves are compact

If slope $\in \mathbb{R} \setminus \mathbb{Q} \Rightarrow$ "noncompact"

If $h = n-1 \Rightarrow \mathcal{F} = \bigcup_{p \in M} T_p F(p)$ is a hyperplane field

"every foliation of codim 1 induces a hyperplane field"

Q: When does a hyperplane come from a foliation?

Theorem 2 [Frobenius]

$\ker(\alpha) = \mathcal{F} \subset TM$ is induced by γ foliation $(\Leftrightarrow) \alpha \wedge d\alpha = 0$

digression: $\alpha_p: T_p M \xrightarrow{\gamma\text{-form}} \mathbb{R}$ $\alpha_p \in (T_p M)^*$

Let x_1, \dots, x_n be coordinates on M

\Rightarrow coordinate vector fields $\partial_{x_1}, \dots, \partial_{x_n}$ form a basis of $T_p M$

Dual basis dx_1, \dots, dx_n , i.e. $dx_i(\partial_{x_j}) = \delta_{ij}$

$\Rightarrow \alpha_p = \sum c_i dx_i$

n -form $\beta: \underbrace{(T_p M) \times \dots \times (T_p M)}_{n \text{ times}} \rightarrow \mathbb{R}$ multilinear, alternating

Δ -product:

1 -forms $\alpha = \sum c_i dx_i$
 $\beta = \sum d_j dx_j$

$\alpha \wedge \beta =$ det. to be linear
 $dx_i \wedge dx_j = -dx_j \wedge dx_i$
 $dx_i \wedge dx_i = 0$

Differential

$d: k$ -form $\rightarrow (k+1)$ -form

$$\sum c_i(p) dx_i \mapsto d\alpha = \sum \frac{\partial c_i}{\partial x_j} dx_j \wedge dx_i$$

Ex: $\gamma = \mathbb{R}^3_{(x,y,z)} \quad \alpha = dx \quad \Rightarrow \quad \alpha \wedge d\alpha$ comes from a foliation
 $d\alpha = d(dx) = 0$

(2) $\alpha = x dy + dz$

$$d\alpha = d(x dy + dz) = d(x dy) + d(dz) = \underbrace{\frac{\partial x}{\partial x} dx \wedge dy}_{=0} + \cancel{\frac{\partial x}{\partial y} dy \wedge dy}$$

$$\alpha \wedge d\alpha = (x dy + dz) \wedge (dx \wedge dy) = x dy \wedge (dx \wedge dy) + dz \wedge dx \wedge dy \\ = dx \wedge dy \wedge dz \neq 0$$

2.2 Contact structures Let M^{2n+1}

* $\gamma^{2n+1} = \ker(\alpha)$ is a contact structure $(\Leftrightarrow \alpha \wedge (d\alpha)^n \neq 0$ is a volume form
 { i.e. $\alpha \wedge (d\alpha)^n \neq 0$ at every point } $\alpha \wedge (d\alpha)^n = \alpha \wedge d\alpha \wedge \dots \wedge d\alpha$

* α is called contact form

* the reeb vector field R_α of α is defined

$$\begin{cases} d\alpha(R_\alpha, \cdot) \equiv 0 \\ \alpha(R_\alpha) \equiv 1 \end{cases}$$

remark: $\alpha \wedge (d\alpha)^n$ is a vol form $\Rightarrow M$ orientable

* $\gamma = \ker(\alpha) = \ker(\tilde{\alpha}) \Leftrightarrow \tilde{\alpha} = f\alpha$ for $f: M \rightarrow \mathbb{R} \setminus \{0\}$

$$\Rightarrow \tilde{\alpha} \wedge (d\tilde{\alpha})^n = (f\alpha) \wedge (d(f\alpha))^n = f\alpha \wedge (fd\alpha + d.f \wedge \alpha)^n$$

$$\alpha \wedge d\alpha = 0$$

$$= \underbrace{f^{n+1}}_{\neq 0} \underbrace{\alpha \wedge (d\alpha)^n}_{\neq 0}$$

* R_α is well-defined:

$$\alpha \wedge (d\alpha)^n \neq 0 \Rightarrow (d\alpha)^n \Big|_{\gamma} \neq 0 \Rightarrow d\alpha \text{ has rank } 2n \\ \nwarrow \text{2n-dimensional} \Rightarrow \ker(d\alpha) \text{ is 1-dim} \\ \text{simple} \quad \& \quad \alpha \neq 0 \text{ on } \ker(d\alpha)$$

Warning (why: \cap closed \Rightarrow ?) \nexists contact form α on \cap : R_{α} is a periodic orbit

Ex) (1) Consider \mathbb{R}^{2n+1}
 $(x_1, y_1, \dots, x_n, y_n, z)$

$\xi_{st} = \ker(\alpha_{st})$ standard contact structure

$$\alpha_{st} = \left(\sum_{i=1}^n x_i dy_i \right) + dz$$

$$\begin{aligned} \alpha_{st} \wedge (d\alpha_{st})^n &= (\sum x_i dy_i + dz) \wedge (d(\sum x_i dy_i + dz))^n = (\sum x_i dy_i + dz) \wedge (\sum d x_i \wedge dy_i)^n \\ &= (\sum x_i dy_i + dz) \wedge \underbrace{(\sum d x_i \wedge dy_i) \wedge (\sum d x_i \wedge dy_i) \wedge \dots \wedge (\sum d x_i \wedge dy_i)}_{\substack{\wedge \\ \vdots \\ \wedge \\ d x_i \wedge dy_i \wedge d x_i \wedge dy_i}} \wedge (\sum d x_i \wedge dy_i)^{n-2} \\ &= (\sum x_i dy_i + dz) \wedge n! (d x_1 \wedge d y_1 \wedge d x_2 \wedge d y_2 \wedge \dots \wedge d x_n \wedge d y_n) \\ &= dz \wedge n! (d x_1 \wedge d y_1 \wedge d x_2 \wedge d y_2 \wedge \dots \wedge d x_n \wedge d y_n) \\ &= n! d x_1 \wedge d y_1 \wedge d x_2 \wedge d y_2 \wedge \dots \wedge d x_n \wedge d y_n \wedge dz \neq 0 \end{aligned}$$

compute $R_{\alpha_{st}} = (\sum A_i dx_i + B_i dy_i) + C dz$

$$d\alpha_{st}(\mathbb{R}_{\alpha_{st}}, \cdot) = \{ A_i dy_i - B_i dx_i = 0 \}$$

$$d\alpha_{st}(\mathbb{R}_{\alpha_{st}}) = C + \{ x_i B_i = 1 \}$$

One solution: $\mathbb{R}_{\alpha_{st}} = \partial_z$

$$(2) \xi_{syn} = \ker \left(\underbrace{\sum_{i=1}^n (x_i dy_i - y_i dx_i)}_{\alpha} + dz \right)$$

Homework: • This is a contact structure

• $R_{\alpha} = \partial_z$

• for $n=1$: draw plots

• read Milnor:

Topology from a differential viewpoint

Jelley Lee

Recall: $(\mathbb{R}^{2n}, \ker(\alpha) = \xi^{2n} \subset T\mathbb{R}^n)$ Contact manifold

(19, 20, 23)

$\Leftrightarrow \alpha \wedge (d\alpha)^n$ is a volume form (i.e. $\neq 0$)

\mathbb{R}^{2n+1}
 $(x_1, y_1, \dots, x_n, y_n, z)$

$$(1) \alpha_{st} = \left(\sum_{i=1}^n x_i dy_i \right) + dz \Rightarrow \alpha \wedge (d\alpha)^n \neq 0$$

$$(2) \alpha_{sym} = \left(\sum_{i=1}^n x_i dy_i - y_i dx_i \right) + dz \Rightarrow \alpha_{sym} \wedge (d\alpha_{sym})^n \neq 0$$

see homework week 7

(3) \mathbb{R}^3 with cylindrical coordinates (θ, r, z)

$$\xi_{OT} = \ker(\alpha_{OT}) = \ker(\cos(r)dz + r \sin(\theta) d\theta)$$

$$d\alpha_{OT} = -\sin(r) dr \wedge dz + \frac{\partial \cos(r)}{\partial \theta} d\theta \wedge dz + (\sin(r) + r \cos(r)) dr \wedge d\theta$$

$= 0$

$$\begin{aligned} \alpha_{OT} \wedge d\alpha_{OT} &= \left[(r \sin^2(r)) - (r \cos(r)) - r \cos^2(r) \right] dr \wedge d\theta \wedge dz \\ &= - \underbrace{\left[1 + \frac{\sin(r) \cos(r)}{r} \right]}_{\neq 0} \underbrace{r d\theta \wedge dr \wedge dz}_{\text{volume form}} \neq 0 \end{aligned}$$

Exercise: $f: (r, \theta, z) \mapsto (x, y, z)$ if you pull that back, you get the volume form

- Look at the volume form on a sphere S^2

When are two contact structures equivalent?

Definition: [Contactomorphisms]

• $f: (\mathbb{R}^2, \xi_1) \longrightarrow (\mathbb{R}^2, \xi_2)$ is called contactomorphism

$\Leftrightarrow f$ is a diffeomorphism s.t. $Tf(\xi_1) = \xi_2$

(i.e. $f^*(\alpha_2) = g \alpha_1$ for some $g: \mathbb{R}^2 \rightarrow \mathbb{R} \setminus \{0\}$)

Proposition: $f: \mathbb{R}^2 \longrightarrow \mathbb{R}^2$

α_2 a 1-form on \mathbb{R}^2

$\alpha_2: T\mathbb{R}^2 \longrightarrow \mathbb{R}$

$$(f^* \alpha_2)_p(x_p) := (\alpha_2)_{f(p)}(T_p f(x_p))$$

SHORT: $f^* \alpha_2(x) = \alpha_2(f(x))$

Example:

$$f: (\mathbb{R}^{2n+1}, \xi_{st}) \longrightarrow (\mathbb{R}^{2n+1}, \xi_{sym})$$

$$(x, y, z) \longmapsto \left(\frac{x+y}{2}, \frac{y-x}{2}, z + \frac{\langle x, y \rangle}{2} \right)$$

is a contactomorphism.

Proof:

$$f^* \alpha_{sym} = \left(\sum_{i=1}^n \frac{x_i + y_i}{2} d\left(\frac{y_i - x_i}{2}\right) - \left(\frac{y_i - x_i}{2}\right) d\left(\frac{x_i + y_i}{2}\right) + d\left(z + \frac{\langle x, y \rangle}{2}\right) \right)$$

$$= \sum_{i=1}^n \frac{x_i + y_i}{2} \frac{dy_i - dx_i}{2} - \left(\frac{y_i - x_i}{2}\right) \frac{dx_i + dy_i}{2} + dz$$

$$+ \sum_{i=1}^n \frac{x_i \cdot dy_i}{2} + \sum_{i=1}^n \frac{y_i \cdot dx_i}{2}$$

$$= dz + \sum_{i=1}^n \left(\frac{x_i dy_i}{2} - \frac{y_i dx_i}{2} + \frac{x_i dy_i}{2} + \frac{y_i dx_i}{2} \right)$$

$$= dz + \sum_{i=1}^n x_i dy_i$$

If $f^* \alpha_2 = \alpha_1$ then f is called symplectic

Thm 3 (Meerburg): $(\mathbb{R}^3, \xi_{st}) \not\stackrel{\text{cont}}{=} (\mathbb{R}^3, \xi_{OT})$ proof in section 4

→ goal: distinguish contact manifolds

Example: $S^{2n-1} \subset \mathbb{C}^n$

Standard contact structure on the sphere:

$$\xi_{st} := TS^{2n-1} \cap (iTS^{2n-1}) \quad \text{HW sheet 1}$$

then $G: (S^{2n-1} \setminus \{pt\}, \xi_{st}) \stackrel{\text{cont}}{=} (\mathbb{R}^{2n-1}, \xi_{st})$

proof: HW, sheet 2

Let W^{2n} be a $(2n)$ -manifold

Def: A symplectic form is a 2-form ω s.t.

$$d\omega = 0 \quad \& \quad \omega^n \text{ is a volume form}$$

Ex: $(\mathbb{R}^{2n}, \omega_{st} := \sum_{j=1}^n dx_j \wedge dy_j)$

Def: a Liouville vector field Y on (W, ω) is a vector field

$$\text{s.t.} \quad d(\iota_Y \omega) = \omega \quad \iota := \text{plug in}$$

Ex: $Y = \frac{1}{2} r, \quad r = \frac{1}{2} (\sum x_i dx_i + y_i dy_i) \Rightarrow \text{Liouville on } (\mathbb{R}^{2n}, \omega_{st})$

$$\iota_Y \omega_{st} = \frac{1}{2} (\sum x_i dy_i - y_i dx_i) \Rightarrow d(\iota_Y \omega_{st}) = \omega_{st}$$

Lemma 5: Let Y be Liouville on (W, ω)

$\Rightarrow \alpha := \iota_Y \omega$ is a contact form
on every hypersurface $\Sigma^{2n-1} \subset W$
transverse to Y .

Ex: $S^{2n-1} \subset (\mathbb{R}^{2n}, \omega_{st})$ is transverse to $Y = \frac{1}{2} r$

$\Rightarrow \alpha = \iota_Y \omega_{st}$ is a contact form

$$= \frac{1}{2} \sum x_i dy_i - y_i dx_i$$

Homework: check directly that α is a
contact form on S^{2n-1}

• sheet 1: $\ker(\alpha) = \mathbb{R} Y$

proof (Lemma 5):

$$\alpha \wedge (d\alpha)^n = \iota_Y \omega \wedge (d(\iota_Y \omega))^{n-1}$$

$$= \iota_Y \omega \wedge \omega^{n-1}$$

$$= \frac{1}{n} \iota_Y (\omega^n)$$

write down coordinates and
compute it explicitly

$\omega^n \neq 0 \Rightarrow \alpha \wedge (d\alpha)^{n-1} \neq 0$ on γ transverse to γ \square

(for me to remind) $\alpha \wedge (d\alpha)^{n-1} (\gamma, \dots) = \frac{1}{n} \omega^n (\gamma, \gamma) = 0$

Given a manifold B^n the space of contact elements:

$$\left\{ (b, V_b) \mid b \in B \Delta V_b^{n-1} \subset T_b B \text{ oriented \& co-oriented by propers} \right\}$$

Lemma 6: Space of contact elements $\cong S^*B$ (unit cotangent bundle)

proof: $(b, V_b) \xrightarrow{\sim} \rightarrow$

$$U_b^{V_b}: T_b B \rightarrow \mathbb{R} \text{ linearly}$$

$$\text{with } \ker(U_b^{V_b}) = V_b$$

V_b oriented & cooriented

$U_b^{V_b}$ is unique up to scaling \square

Theorem 7 $\pi: S^*B \rightarrow B$

Define a hyperplane field ξ_{can} on S^*B as follows:

$$(T\pi)^*(V_b) =: \xi(b, U_b^{V_b}) \subset T(S^*B) \longrightarrow S^*B \ni (b, U_b^{V_b}: T_b B \rightarrow \mathbb{R})$$

$$\begin{array}{ccc} & & \\ & \downarrow T\pi & \downarrow \pi \\ V_b \subset T_b B & \xrightarrow{\quad} & B \end{array}$$

$\Rightarrow \xi_{\text{can}}$ is a contact structure called the canonical contact structure

Proof: Let (q_1, \dots, q_n) be local coordinates on B and (p_1, \dots, p_n) be dual coordinates in the fibers of T^*B , i.e. $(q_1, \dots, q_n, p_1, \dots, p_n) = (\sum_{j=1}^n p_j dq_j) \in T^*B$

$$V_{(q_1, \dots, q_n)} = \left\{ \sum_{j=1}^n p_j dq_j = 0 \right\}$$

□

McLaurin Lagrangian conjecture $M \stackrel{\text{cont.}}{\cong} N \Rightarrow (S^*M, \xi_{\text{can}}) \stackrel{\text{cont.}}{\cong} (S^*N, \xi_{\text{can}})$

Ex: $B = T^2$ or $B = \mathbb{R}^2$ or $B = \mathbb{D}^2$ with coordinates (x, y) .

$$\Rightarrow S^*B \cong S^1 \times B$$

$$\xi_{\text{can}} = \ker(\sin \theta dx - \cos \theta dy)$$

2.3 Gray stability, the Moser trick and Darboux's Theorem

Lemma 1: Let $\omega_t, t \in [0, 1] =: I$ a smooth family of k -forms on M and $(\psi_t)_{t \in I}$ an isotopy (i.e. $\psi_0 = \text{id}_M$, ψ_t diffeo of M)

Define a vector field X_t by $X_t \cdot \psi_t = \dot{\psi}_t$

$$\Rightarrow \frac{d}{dt}(\psi_t^* \omega_t) = \psi_t^* (\dot{\omega}_t + L_{X_t} \omega_t)$$

$$L_X \omega = d(L_X \omega) + L_X d\omega$$

proof: sheet 2, bonus exercise

Theorem 9 (Gray stability)

Let $\xi_t, t \in I$ be a family of contact structures on M , M closed.

$\Rightarrow \exists$ isotopy $(\psi_t)_{t \in I}$ on M s.t. $T\psi_t(\xi_0) = \xi_t \quad \forall t \in I$

Ex: This is wrong for foliations:

$F_t = \text{curves of slope } s$

$s \in \mathbb{Q}$: leaves are all closed

$s \in \mathbb{R} \setminus \mathbb{Q}$: leaves are all open

$\Rightarrow F_t$ for $s_0 \in \mathbb{Q}$ and $s_1 \in \mathbb{R} \setminus \mathbb{Q}$ are not isotopic.

proof (thm 9 via Moser trick)

Let α_t smooth s.t. $\ker(\alpha_t) = \xi_t$. Need to construct: ψ_t with $\psi_t^*(\alpha_t) = \lambda_t \alpha_0$,

$$\lambda_t: \mathcal{M} \rightarrow \mathbb{R}_+$$

Assume ψ_t is the flow of a vector field X_t .

$$\Rightarrow \frac{d}{dt}(\psi_t^*(\alpha_t)) = \dot{\lambda}_t \alpha_0 = \frac{\dot{\lambda}_t}{\lambda_t} \psi_t^* \alpha_t = \psi_t^*(\mu_t \alpha_t) \quad (\text{with } \mu_t = \frac{d}{dt}(\log(\lambda_t)) \circ \psi_t^{-1})$$

With Lemma 8, on the other hand, we have

$$\frac{d}{dt}(\psi_t^*(\alpha_t)) = \psi_t^*(\dot{\alpha}_t + L_{X_t} \alpha_t) = \psi_t^*(\dot{\alpha}_t + d(\alpha_t(X_t)) + L_{X_t}(d\alpha_t)).$$

As ψ_t is a diffeomorphism, this is equivalent to

$$(\Leftarrow) \mu_t \alpha_t = \dot{\alpha}_t + d(\alpha_t(X_t)) + L_{X_t}(d\alpha_t)$$

If furthermore $X_t \in \xi_t = \ker(\alpha_t)$

$$(\Leftarrow) \mu_t \alpha_t = \dot{\alpha}_t + L_{X_t} d\alpha_t \quad (\otimes)$$

Plugging in $R\alpha_t$, we obtain $\mu_t = \dot{\alpha}_t(R\alpha_t)$.

• Define $\mu_t := \dot{\alpha}_t(R\alpha_t)$

• $R\alpha_t \in \ker(\mu_t \alpha_t - \dot{\alpha}_t) \times d\alpha_t|_{\xi_t}$ non-degenerate $\Rightarrow \exists!$ solution $X_t \in \xi_t$ of (\otimes)

• \mathcal{M} closed \Rightarrow flow ψ_t of X_t is globally defined \square

Def A vector field on $(\mathcal{M}, \xi = \ker(\alpha))$ is called contact vector field

(\Leftarrow) Flow ψ_t of X is a contactomorphism, i.e. $T\psi_t(\xi) = \xi$

$$(\Leftarrow) L_X \alpha = \mu \cdot \alpha \text{ for } \mu: \mathcal{M} \rightarrow \mathbb{R}$$

Ex 1: $\mathcal{M} = S^1 \times \mathbb{R}^2 \quad \alpha = \cos(\theta)dx + \sin(\theta)dy$

$$X = x\partial x + y\partial y$$

$$L_X \alpha = d\alpha(X) + L_X d\alpha$$

$$= d(x\cos\theta + y\sin\theta) + L_X(-\sin\theta d\theta \wedge dx + \cos\theta d\theta \wedge dy)$$

$$= \cos\theta dx + \sin\theta dy - x\sin\theta d\theta + y\cos\theta d\theta + \sin\theta x d\theta - \cos\theta y d\theta$$

$$= \alpha$$

$\Rightarrow X$ is a contact vector field

Ex 2: $L_{R\alpha} \alpha = d(L_{R\alpha}(\alpha)) + L_{R\alpha} d\alpha = d \underbrace{\alpha(R\alpha)}_{=1} + \underbrace{L_{R\alpha} d\alpha}_{=0} = 0$

$\Rightarrow R\alpha$ is a contact vector field

Thm 10: Let α with $\ker \alpha = \{0\}$. Then

$$\left\{ \begin{array}{l} \text{contact} \\ \text{vector} \\ \text{fields} \end{array} \right\} \xrightarrow{\gamma: \gamma} C^\infty(M, \mathbb{R})$$

$$X \xrightarrow{\quad} \alpha(X) =: H_X$$

$$\left. \begin{array}{l} \alpha(x_H) = H \\ L_{x_H} d\alpha = dH(N_\alpha)\alpha - dH \end{array} \right\} =: x_H \longleftarrow H$$

Observe: $N_\alpha \in \ker(dH(N_\alpha)\alpha - dH)$

proof: " \longrightarrow " Given x . Define $H_x := \alpha(x)$
 $\Rightarrow dH_x + L_x d\alpha = L_x \alpha = \mu \cdot \alpha$

plug in N_α
 $\Rightarrow dH_x(N_\alpha) + \underbrace{d\alpha(x, N_\alpha)}_{=0} = \mu \cdot \underbrace{\alpha(N_\alpha)}_{=1}$

$$\Rightarrow L_x d\alpha = dH_x(N_\alpha) \cdot \alpha - dH_x$$

$$\Rightarrow x_{H_x} = x$$

" \longleftarrow " Given H . Define x_H as above

$$\bullet L_{x_H} \alpha = d(\underbrace{\alpha(x_H)}_H) + L_{x_H} d\alpha = dH(N_\alpha)\alpha = \alpha \Rightarrow x_H \text{ is a contact vector field}$$

$$\bullet H_{x_H} = \alpha(x_H) = H$$

Thm 11 (Darboux) Let α be a contact form on M^{2n+1} and let $p \in M$.

$\Rightarrow \exists$ NBHD $U \subset M$ of p & coordinates $(x_1, \dots, x_n, y_1, \dots, y_n, z)$ on U s.t.

$$p = (0, \dots, 0) \text{ and } \alpha|_U = \left(\sum_{j=1}^n x_j dy_j \right) + dz$$

proof (via Moser trick) wlog $M = \mathbb{R}^{2n+1}$ (because we are working locally) and $p=0$.

Choose coordinates s.t. on $T_0 \mathbb{R}^{2n+1}$: $\alpha(\partial z) = 1$; $\partial z d\alpha = 0$; $\partial x_j, \partial y_j \in \ker \alpha$; $d\alpha = \sum_{j=1}^n dx_j \wedge dy_j$

$$\text{define } \alpha_0 := \left(\sum_{j=1}^n x_j dy_j \right) + dz$$

$$\alpha_t := (1-t)\alpha_0 + t\alpha, \quad t \in I$$

$$\Rightarrow \alpha_t := (1-t)\alpha_0 + t\alpha, \quad t \in I$$

$\Rightarrow \alpha_t \geq \alpha$ & $d\alpha_t = d\alpha$ at $p=0 \Rightarrow \alpha_t$ is contact form $\forall t$ on a NBHD of $p=0$
 (because it's contact at 0 \Rightarrow non-zero at $p=0$
 \Rightarrow non-zero is a NBHD of 0)

Moser trick: Assume $\psi_t^* \alpha_t = \alpha_0$ for ψ_t the flow of X_t .

Lemma 8
 $\Rightarrow \psi_t^* (\dot{\alpha}_t + L_{X_t} \alpha_t) = 0 \Leftrightarrow \dot{\alpha}_t + d(\psi_t^* \alpha_t(X_t)) + L_{X_t} d\alpha_t = 0$

write $X_t = H_t N_{\alpha_t} + Y_t$ for $Y_t \in \ker(\alpha_t)$ & plug in N_{α_t} : $\dot{\alpha}_t(N_{\alpha_t}) + dH_t(N_{\alpha_t}) = 0$

On a NBHD of $p=0$ where N_{α_t} has no closed orbit \exists solution of $\dot{\alpha}_t + dH_t = 0$ with $H_t(0)=0$, $dH_t|_0 = 0 \forall t \in I$.

Define Y_t by $\dot{\alpha}_t + dH_t + L_{Y_t} d\alpha_t = 0 \Rightarrow X_t(0)=0 \Rightarrow \psi_t := \text{flow of } X_t$ is defined $\forall t \in I$ on a NBHD of $p=0$.
