Homework Problem 1.1   (Miscellaneous on Convergence Rates)   9.5 Points

(i) Explain why the definition of Q-quadratic convergence of a sequence requires the initial assumption that the sequence converges at all.

(ii) Show that Q-quadratic convergence implies Q-superlinear convergence which implies Q-linear convergence which implies convergence.

(iii)   (a) Show that the notions of Q-linear, Q-superlinear and Q-quadratic convergence of a sequence imply their respective R-convergence counterparts.

   (b) Give an example that shows that R-convergence of a sequence generally does not imply Q-convergence.

(iv)   (a) Let $\|\cdot\|_a$, $\|\cdot\|_b \colon \mathbb{R}^n \to \mathbb{R}$ be equivalent norms. Show that Q-superlinear resp. Q-quadratic convergence of a sequence w.r.t. $\|\cdot\|_a$ implies Q-superlinear resp. Q-quadratic convergence w.r.t. $\|\cdot\|_b$.

   (b) Give an example that shows that a similar statement can not hold for Q-linear convergence. Does it hold for R-linear convergence?

Homework Problem 1.2

(Visualizing and Interpreting Convergence Rates)   7 Points

(*i*) For each of the following cases, give an example of a null sequence $(x^{(k)})$ in $(\mathbb{R}, |\cdot|)$ that

  (a) converges, but does not converge Q-linearly,

  (b) converges Q-linearly, but does not converge Q-superlinear,

  (c) converges Q-superlinearly, but does not converge Q-quadratically,

  (d) converges Q-quadratically.

(*ii*) Explain what the Q-convergence rates of a sequence $x^k \to x^*$ will look like in a semi-logarithmic plot, i. e., when plotting the map $k \mapsto \ln |x\_k - x^*|$.

(*iii*) Plot the distance to the limit for the sequences from task (*i*) over the iterations in a standard and a semi-logarithmic plot. What do you observe?

Homework Problem 1.3 (Optimality Condition Gap)   9 Points

Consider the optimization problem

$$\text{Minimize} \quad f(x) = \left(x_1 - x_2^2\right)\left(2x_1 - x_2^2\right) = 2x_1^2 - 3x_1 x_2^2 + x_2^4 \quad \text{where } x \in \mathbb{R}^2.$$

(*i*) Show that the necessary optimality conditions of first and second order are satisfied at $(0,0)^\mathsf{T}$.

(*ii*) Show that $(0,0)^\mathsf{T}$ is a local minimizer for f along every straight line passing through $(0,0)$.

(*iii*) Show that $(0,0)^\mathsf{T}$ is not a local Minimizer of f on $\mathbb{R}^2$.

Homework Problem 1.4 (First Order Conditions are Sufficient for Convex Functions)   2 Points

Let $f \colon \mathbb{R}^n \to \mathbb{R}$ be a convex function that is differentiable at $x \in \mathbb{R}^n$ with $f'(x) = 0$. Show that x is a global minimizer of f.
